

Permanent Magnet Figures of Merit: We need a better story

Stan Trout

SMMA Fall 2008 Technical Conference

October 17, 2008

Spontaneous Materials

Michael Faraday

Source: St. Andrews College

- Physicist & Chemist
- 1791-1867
- The Farad
- Explained much of what we know about magnetic forces
- Made some of the first electric motors and generators

Energy Efficiency and Inflation
The Motor Design Challenge

Spontaneous Materials

Michael Faraday

Source: St. Andrews College

- When asked by a politician what good they were, he replied “At present I do not know, but one day you will be able to tax them.”

Energy Efficiency and Inflation
The Motor Design Challenge

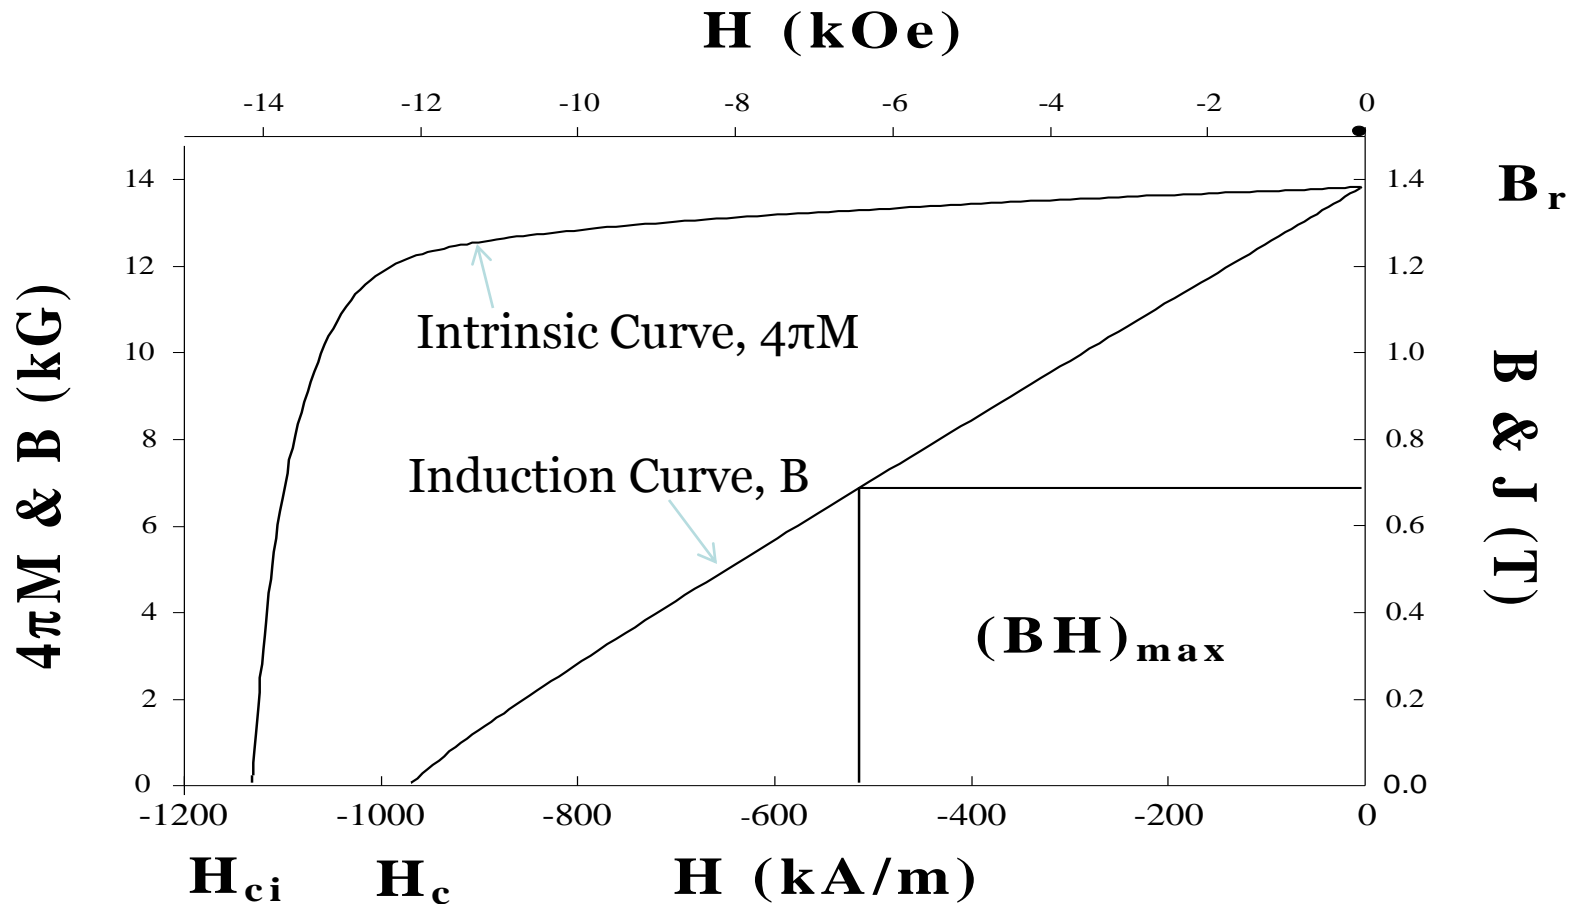

SMMA 2008 Fall Technical Conference
October 15-17, 2008
Sheraton Westport Plaza Hotel, St. Louis

Spontaneous Materials

Outline

- Two common figures of merit
 - H_{ci}
 - $(BH)_{max}$
- What they tell us?
- What they don't tell us?
- Are they misleading?
- Other figures of merit
 - H_k
 - $(MH)_{max}$
 - Curie Temperature
 - Cost per pound
 - Flux/buck or J/\$
- Quality Factor
- Conclusions

H_{ci} and $(BH)_{max}$

Energy Efficiency and Inflation
The Motor Design Challenge

SMMA 2008 Fall Technical Conference
October 15-17, 2008
Sheraton Westport Plaza Hotel, St. Louis

Spontaneous Materials

Value of H_{ci}

What it tells us

- Strictly speaking
 - At H_{ci} , $M=0$
 - At H_c , $B=0$
 - $H_{ci} \geq H_c$
- Resistance to demagnetization

What it doesn't tell us

- Behavior at other points
- Available flux
- Cost

Is it misleading?

- *Never* used at H_{ci}
- As a thermal parameter

Value of $(BH)_{\max}$

What it tells us

- Related to flux in gap

$$B_{\text{gap}} \approx \sqrt{\frac{(BH)_{\max} V_{\text{magnet}}}{V_{\text{gap}}}}$$

- Most magnets operate near $(BH)_{\max}$
- Near $(BH)_{\max}$ is good enough

What it doesn't tell us

- Resistance to demag
- Cost
- Thermal

Is it misleading?

- A 10% increase in $(BH)_{\max}$ is only a 5% increase in B_{gap}
- Over emphasized

Energy Efficiency and Inflation

Spontaneous Materials

Definition of H_k

Energy Efficiency and Inflation
The Motor Design Challenge

 SMMA 2008 Fall Technical Conference
October 15-17, 2008
Sheraton Westport Plaza Hotel, St. Louis

Spontaneous Materials

Value of H_k

What it tells us

- Loop “squareness”
- No droopy loops
- Better than H_{ci}

What it doesn't tell us

- Available flux
- Cost
- Thermal

Is it misleading?

- Not really

Definition of $(MH)_{\max}$

Energy Efficiency and Inflation
The Motor Design Challenge

SMMA 2008 Fall Technical Conference
October 15-17, 2008
Sheraton Westport Plaza Hotel, St. Louis

Spontaneous Materials

Curie Temperature

$4\pi M_s$ vs T

Energy Efficiency and Inflation
The Motor Design Challenge

SMMA 2008 Fall Technical Conference
October 15-17, 2008
Sheraton Westport Plaza Hotel, St. Louis

Spontaneous Materials

Value of T_c

What it tells us

- Strictly speaking
 - $M=0$ at T_c
- Upper limit on use
- Universally understood

What it doesn't tell us

- Behavior at lower temps.
- Available flux
- Cost

Is it misleading?

- *Never* used at T_c
- No clue on realistic upper temperature limit

Basic Data

| | A | B | C | D | E | F | G | H | I |
|----|------------|-------|----------|--------------|-------|-------|---------|----------------------|-----------|
| 1 | | | | | | | | | |

Energy Efficiency and Inflation
The Motor Design Challenge

Spontaneous Materials

Conclusions

- H_{ci} and $(BH)_{max}$ are useful but insufficient
- The Quality Factor may be more enlightening
- The Quality Factor can be made application specific
 - Omit irrelevant parameters
 - Accentuate critical parameters
- If you want the spreadsheet, send me a note strout@ieee.org
